Boardy Document Interaction Test

A four page fixture for validating upload, multipage navigation, editing, annotation, revision history, and download behavior.

4	3	2	1
Pages	File formats	Visual systems	Revision trail

Testing objective

Insert this file on the canvas, double click it, add a comment and a visible edit, wait for autosave, then download the newest revision. The downloaded copy should preserve the change while the original revision remains available in history.

Workflow diagram

This page checks vector and raster rendering, wide visual scaling, and annotations placed over mixed content.

Operating workflow

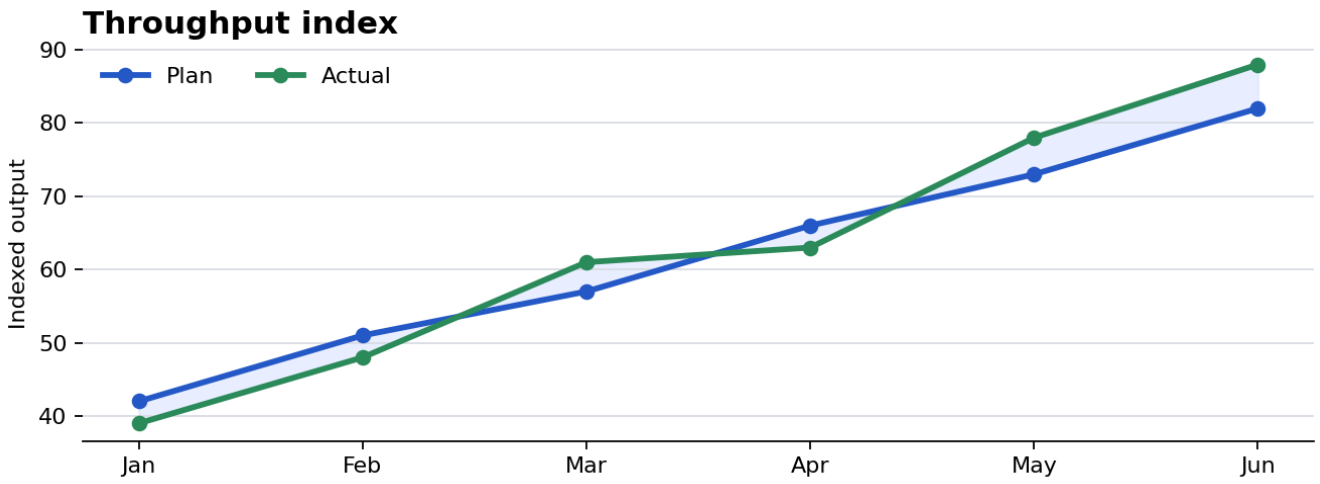

Each handoff is explicit, reviewable, and reversible.

Checkpoint	Expected interaction	Pass condition
Upload	Select PDF DOCX or DOC	Canvas element appears
Activate	Double click document	Editor receives pointer input
Annotate	Draw or comment	Mark is visible and saveable
Download	Export latest revision	Correct filename and bytes

Performance graph

A line chart with legend, labels, gridlines, and filled variance makes clipping and image degradation easy to spot.

Interpretation

The illustrative series crosses twice and ends six points above plan. Values are synthetic and exist only to exercise chart rendering, not to make a business claim.

Annotation target: circle the final green point and write approved in the margin.

Multipage acceptance checklist

Complete these checks in both Chrome and Safari. Repeat at desktop width and below 720 pixels.

Check	Chrome	Safari
All four pages render	■	■
Text selection and zoom work	■	■
Annotation persists after save	■	■
New revision downloads	■	■
Filename and format are correct	■	■

Expected save result

The newest revision should be downloadable without replacing the original. For legacy DOC, the edited result may be upgraded to DOCX and must be labeled accordingly.
